

**Summary of Process:** The user will choose from the home menu what they want to learn about, they will then choose which topic-related component they would like to see. Once chosen, the user will be taken to a separate window that will be an interactive interface where the user can learn more about the selected topic. Once they are ready to return back to the main menu they can choose the main menu button that is in each of our components. From the main menu, they can choose to learn about another topic or exit the app using the arrow in the corner.

**Input:** User selection is the input (One of the individual components, main menu button or exit)

**Output:** Individual components: Steven, Waylin, Eleni, Jose, Junaid or back to main menu

**Other Variables:** any variables that are used in each individual components (which are on the individual algorithms)

1. App loads background image and buttons
2. User selects option from main menu via different buttons. Each button goes to each of our individual components (Waylin, Eleni, Steven, Jose, Junaid).
3. Call to function of selected option
4. Make main menu invisible.
5. [individual component algorithm]
6. If the user selects option to go back to main menu from individual component then the app will go back to step 1
7. Repeat steps 1-4 until the user chooses to exit app.
8. If the user exits out using the arrow in the corner, the program closes.
